

Have you ever tried to run a PowerShell script completely silent, without the blue box momentarily flashing? One solution is to launch PS with a vbscript, another is to use PSRun.exe

PSRun.exe replaces PowerShell.exe in your command line.

Example:

```
PSRun.exe -NoProfile -ExecutionPolicy Bypass -File yourscrip.ps1
```

Requirements:

DotNet 4.5

The utility is far from unique, but it has served us well for a while, so we thought we might as well make it available to others.
